The history of AutoCAD is described in the Wikipedia article. Before the launch of AutoCAD, the first desktop-based CAD application was designed by Atari Corporation in 1979 and released the following year as the Graphics System Manager (GSM) for the Atari 8-bit computers. The first commercially available computer-aided design (CAD) software was designed and marketed by Peter Seipel in 1981 for the IBM personal computer; it was called Cam-Ply, a wordplay on "Computer Aided Drafting Program". The Autodesk AutoCAD app was released in 1982. How AutoCAD's Project Browser works The system-wide project file containing all the files for the entire project is stored in an XML file. XML is a special-purpose markup language for describing information. The project-file contains a list of units, sub-files, and other project elements. The XML project-file contains a unit definition section that contains the UnitDefinition node, which is a container for any unit used in the project. Each unit has a ProjectRootPath, which is the path to the top-level directory for the project, and a UnitName, which is the name of the unit. Each unit has a list of unit sub-files. Each unit sub-file has a FileName, which is the name of the file containing the code of the unit, and a UnitType, which is the type of unit that the file is. A unit sub-file can contain a list of sub-files, with each sub-file having a UnitType. The project-file has a file that is the root of the project, which has a ProjectRootPath and a UnitName. This file is the "root of the tree" for the whole project. The structure of the XML project-file is shown in the diagram. The unit definition section defines a "Unit" element, which is a container for a list of "UnitSubfiles". Each "UnitSubfile" defines the top-level folder that contains the folder structure of the project. Each top-level folder has a UnitName, a FolderName, and a ProjectRootPath, which is the location of the top-level folder. Each top-level folder can have a list of sub-folders. Each sub-folder has a UnitName. The "UnitSubfile" element is repeated for each top-

I don't want this rendered HTML included in any Google Analytics reports that are sent, so I tried adding some code to my library. I have added the following in a function inside my library: var _gaq = _gaq || []; _gaq.push(['_setAccount', 'UA-xxxxxxxx-1']); _gaq.push(['_trackPageview']); (function() { var ga = document.createElement('script'); ga.type = 'text/javascript'; ga.async = true; ga.src = ('https:' == document.location.protocol ? '' : 'https://') + 'google-analytics.com/ga.js'; var s = document.getElementsByTagName('script')[0]; s.parentNode.insertBefore(ga, s); })(); This worked. The data coming through now doesn't have the library as the referring page in the data. However, I am now seeing this message: Your account appears to already be
